Portfolio

SUMMARY

Frontend Developer with 3 years of experience building production React.js and Next.js applications for Jaguar Land Rover and McLaren at Tata Technologies. Comfortable owning a feature end-to-end – from component design and state management to API integration and testing – across large, multi-team codebases.

SKILLS

Frontend: React.js (Hooks, Context API, Router), Next.js, Angular, TypeScript, JavaScript (ES6+), HTML5, CSS3, Tailwind CSS, Material UI, Redux Toolkit, React Query, State Management, Micro Frontend Architecture

Backend & DB: Spring Boot, GraphQL, Axios, MySQL, Neo4j (Cypher)

Testing & Tools: Jest, React Testing Library, Webpack, Vite, Git, GitHub Actions, Docker, Postman, Figma, Jira

EXPERIENCE

Tata Technologies | *Role – Software Developer (Frontend Developer)* | Pune, Maharashtra | **August 2023 – Present**

Client - Jaguar Land Rover, UK - Rental Fleethub (2025–Present)

- Built complex, multi-step booking forms with React Hooks and React Query, integrating them against 15+ REST endpoints for fleet availability and pricing, with TypeScript used throughout for type safety across shared data models.
- Implemented Redux-based session handling and JWT authentication with role-based access, working closely with the backend team to align on token refresh and permission contracts, cutting reported session-related bugs by roughly a third.
- Built filtering, pagination, and sorting for 15+ responsive micro-frontend modules, bringing page load times down noticeably on data-heavy screens through memoization and virtualized lists.
- Added a batch export feature for records so users no longer had to download files one at a time; also set up the GitHub Actions CI/CD pipeline and containerized the build with Docker for consistent deployments.
- Collaborated with designers in Figma to translate mockups into pixel-accurate, responsive components, and tracked feature work through sprint cycles in Jira.

Client - Jaguar Land Rover, UK - ToolBox (2024–2025)

- Implemented JWT + OAuth 2.0 authentication and connected 45+ REST APIs via Axios for the internal tooling dashboard, adding centralized error handling and request interceptors for consistent retry behavior.
- Built a set of 12+ reusable, accessible form components with React Hook Form and Material UI, following SOLID principles, used across several teams to standardize input handling.
- Handled state management with Redux Toolkit across 10+ slices and wrote unit tests with Jest and React Testing Library to catch regressions before release.
- Queried and modeled relational data in MySQL to support new tooling features, and used GraphQL for a few endpoints where clients needed flexible, nested data fetching.

Client - Jaguar Land Rover, UK - NVRS: New Vehicle Registration System (2024)

- Rebuilt date-range filtering to be faster and more accessible, cutting search time from 2.5s to under 1s by moving filter logic off the main thread and debouncing user input.
- Fixed a batch of React rendering bugs reported by QA during regression testing, and added test coverage around the affected components to prevent recurrence.

Client - McLaren, UK - Validator Frontend Scope of Work (2023–2024)

- Built the frontend for a Neo4j-backed inventory tool handling 10,000+ records, rendering graph relationships between parts and validators in an accessible, navigable UI.
- Authored 50+ Cypher-based test cases alongside the QA team to validate query correctness and catch data inconsistencies before release.

PROJECTS

Food Ordering App [Code](#) (2024)

- Built a mobile-first ordering UI in React and Tailwind CSS with lazy-loaded routes, and wrote Jest/RTL tests covering the core ordering flow from cart to checkout.
- Wired up live menu and order APIs with React Query, keeping the UI responsive during data fetching and handling loading/error states gracefully.

AI-Enabled B2B Invoice Management System [Code](#) (2023)

- Built a full-stack invoice system (React, Java, JDBC, MySQL) with a simple ML model to predict payment due dates from historical invoice data.
- Added search and filtering for invoices and connected the frontend to REST APIs to support common B2B workflows like approvals and payment tracking, with role-based views for different user types.

EDUCATION

Institute of Technical Education and Research | *B.Tech in Computer Science and Engineering – CGPA: 8.47* | Bhubaneswar, India | **2019–2023**

ACHIEVEMENTS

Managed Network Expert at Chegg – Recognized for technical expertise and community contributions.
